

Table 1: Goodness of fit of the weighted-cumulative-exposure log-hazard-ratio estimators across the six simulation scenarios of Figure ?? . Entries are the root-mean-square error (RMSE) and mean absolute error (MAE) of $\hat{f}(l)$ relative to the true curve over lags $l = 0, \dots, 15$, averaged over 300 simulations; the smallest value in each row is in bold. All entries are multiplied by 10^3 .

Scenario	Knot-search RCspline		Term-search RCspline		Polynomial (df=5)	
	RMSE	MAE	RMSE	MAE	RMSE	MAE
Unimodal	0.94	0.72	2.59	2.03	0.82	0.63
Damped exponential	0.90	0.68	2.04	1.62	0.60	0.46
Bimodal 1	2.20	1.96	1.46	1.16	2.02	1.79
Bimodal 2	2.30	1.84	6.36	5.15	3.84	3.08
Null effects	0.32	0.26	1.18	0.90	0.39	0.31
Constant positive effects	2.51	2.09	8.51	6.76	2.80	2.23

Table 2: Goodness of fit of the term-search RCspline estimator under different candidate knot grids (unimodal scenario, 100 simulations). RMSE and MAE are multiplied by 10^3 .

Candidate knot grid	RMSE	MAE
0 to 15	2.80	2.20
0, 2, 4, ..., 14	1.08	0.84
0, 4, 8, 12, 15	0.97	0.75
